Powering Ahead
Generac Bi-Fuel™ generators start on diesel fuel and add natural gas as load is applied until the unit runs primarily on natural gas. Generac’s Bi-Fuel generators are fully integrated solutions, not aftermarket conversions in the field. That means every component is specifically designed, engineered and factory-validated to work together. Generac Bi-Fuel generators have the added benefit of being EPA-compliant from the factory.

RISK MITIGATION VIA FUEL REDUNDANCY
Because nobody can predict how long a power outage will last, many diesel-fueled standby power systems are sized for extended running times. Nevertheless, onsite diesel fuel supplies are limited, and infrastructure damage could make refueling difficult. Generac Bi-Fuel generators make the most of an onsite diesel fuel supply by running primarily on natural gas. That means less onsite diesel fuel is required and running times will be greatly extended compared to diesel-only solutions. And because the natural gas infrastructure tends not to be affected by the same conditions that lead to power outages, fuel reliability is improved.

LOWER TOTAL COST OF OWNERSHIP
Because natural gas costs less than diesel, fuel costs are significantly reduced over the long term. And since less onsite diesel fuel is required for long running times, installation, operational and maintenance costs are reduced.

SCALABILITY AS PART OF A MODULAR POWER SYSTEM
Generac Bi-Fuel generators can be configured as part of a Modular Power System (MPS)—connected via integrated paralleling with other Generac generators. This makes the system scalable, meaning there is no need to install more power than you need.

CODE COMPLIANCE
Generac Bi-Fuel generators meet the onsite fuel requirements for emergency systems as referenced in NEC700 and NFPA 110. Less onsite diesel fuel means easier permitting. And indoor fuel installations with capacity limits per NFPA or local codes become a viable option.
